Semantic-enabled Agile Knowledge-based eGovernment (SAKE) is a research project realised by an international consortium of partners, co-financed from the 6th Framework Programme for Research and Technological Development. SAKE project commenced on the 1st of March 2006 and is expected to end by February 2009.

Semantic enhancement

The SAKE platform puts the user in the centre of processes and tasks. The system **'learns'** from user preferences, and from implicit information retrieved from the work environment, relations etc.

The time of the Public Administrator is precious: SAKE supports its optimal usage providing ready – to – use, context – enabled recommendation in every difficult situation.
